

LAB - 5

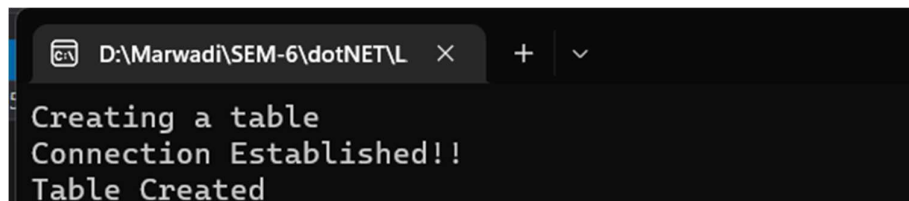

Program 1: Write a C# Console based application to create following table using ADO. Net.

Code:

```
using System;
using System.Data.SqlClient;

namespace Practical5
{
    2 references
    class Database
    {
        string connection_str = @"Data Source=(localdb)\ProjectsV13;Initial Catalog=master;Integrated Security=True;Connect
        Timeout=30;Encrypt=False;TrustServerCertificate=False;ApplicationIntent=ReadWrite;MultiSubnetFailover=False";
        1 reference
        public void create()
        {
            try
            {
                SqlConnection conn = new SqlConnection(connection_str);
                conn.Open();
                Console.WriteLine("Connection Established!!");
                string sql = @"create table employee (Emp_id int IDENTITY(1,1) PRIMARY KEY , Name varchar(30), Designation
                varchar(30), Department varchar(30), Salary int)";
                SqlCommand command = new SqlCommand(sql, conn);
                Console.WriteLine("Table Created");
                command.ExecuteNonQuery();
                command.Dispose();
                conn.Close();
            }
            catch (Exception e)
            {
                Console.WriteLine("Table already existing in database!!!");
            }
        }
    }
}
```

Output:

```
D:\Marwadi\SEM-6\dotNET\L  x  +  v
Creating a table
Connection Established!!
Table Created
```

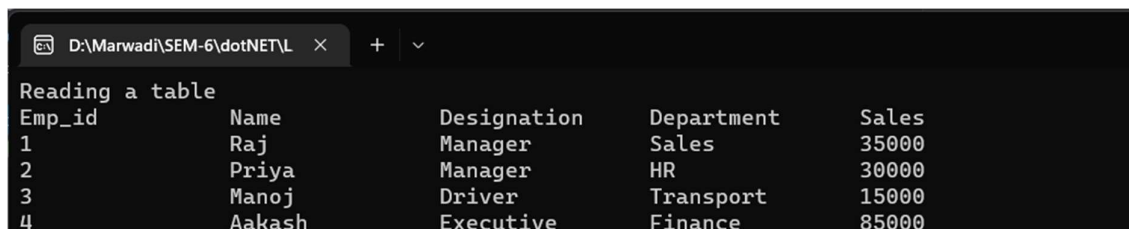

Program 2: Write a C# Console based application to display all the records of a table.

Emp_id	Name	Designation	Department	Salary
1	Raj	Manager	Sales	35000
2	Priya	Manager	HR	30000
3	Manoj	Driver	Transport	15000
4	Aakash	Executive	Finance	85000

Code:

```
1 reference
public void read()
{
    try
    {
        string output = "";
        SqlConnection conn = new SqlConnection(connection_str);
        conn.Open();
        string sql = "SELECT * FROM employee";
        //string sql = "SELECT * FROM employee WHERE Emp_id=1";
        SqlCommand command = new SqlCommand(sql, conn);
        SqlDataReader dataReader = command.ExecuteReader();
        Console.Write(format("Emp_id") + format("Name")+ format("Designation")+ format("Department")+ format("Sales") + "\n" );
        while (dataReader.Read())
        {
            output = output + format(dataReader.GetValue(0).ToString()) + format(dataReader.GetValue(1).ToString()) + format
            (dataReader.GetValue(2).ToString()) + format(dataReader.GetValue(3).ToString()) + format(dataReader.GetValue(4).ToString())
            + "\n";
        }
        Console.Write(output);
        dataReader.Close();
        command.Dispose();
        conn.Close();
    }
    catch (Exception e)
    {
        Console.WriteLine(e);
    }
}
```

Output:

```
D:\Marwadi\SEM-6\dotNET\L  x + v
Reading a table
Emp_id      Name      Designation  Department  Sales
1           Raj       Manager      Sales       35000
2           Priya     Manager      HR          30000
3           Manoj     Driver       Transport   15000
4           Aakash    Executive    Finance     85000
```

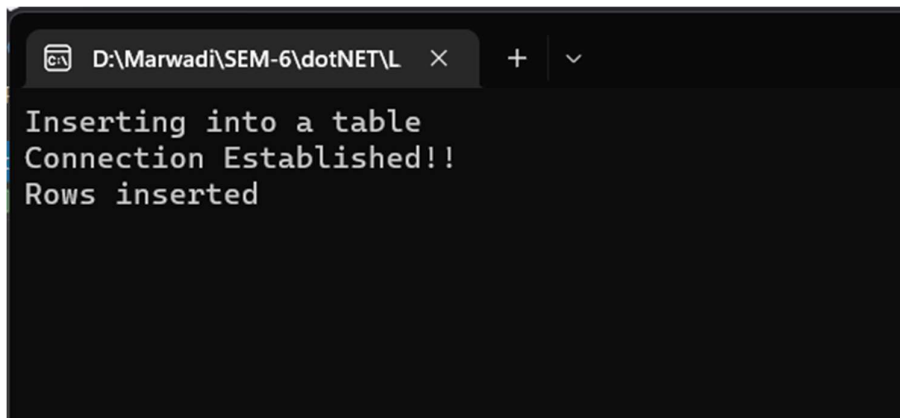

LAB - 6

Program 1: Write a C# Console based application to implement a functionality to insert a new record in the table

Code:

```
0 references
public void insert()
{
    try
    {
        SqlConnection conn = new SqlConnection(connection_str);
        conn.Open();
        Console.WriteLine("Connection Established!!");
        string sql = @"INSERT INTO employee ( Name, Designation, Department, Salary) VALUES ('Raj', 'Manager', 'Sales', 35000);
                        insert into employee(Name, Designation, Department, Salary) values('Priya', 'Manager', 'HR', 30000);
                        insert into employee(Name, Designation, Department, Salary) values('Manoj', 'Driver', 'Transport', 15000);
                        insert into employee(Name, Designation, Department, Salary) values('Aakash', 'Executive', 'Finance', 85000); ";
        SqlCommand command = new SqlCommand(sql, conn);
        Console.WriteLine("Rows inserted");
        command.ExecuteNonQuery();
        command.Dispose();
        conn.Close();
    }
    catch (Exception e)
    {
        Console.WriteLine(e);
    }
}
```

Output:

```
D:\Marwadi\SEM-6\dotNET\L  x  +  v
Inserting into a table
Connection Established!!
Rows inserted
```

Program 2: Write a C# Console based application to implement a functionality to display specific record from the table

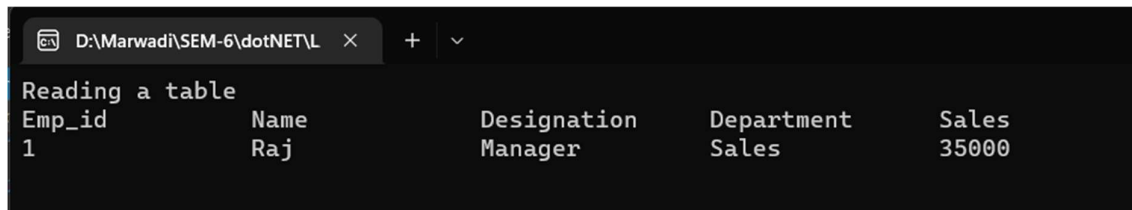

Code:

```
public void read()
{
    try
    {
        string output = "";
        SqlConnection conn = new SqlConnection(connection_str);
        conn.Open();
        //string sql = "SELECT * FROM employee";
        string sql = "SELECT * FROM employee WHERE Emp_id=1";
        SqlCommand command = new SqlCommand(sql, conn);
        SqlDataReader dataReader = command.ExecuteReader();
        Console.WriteLine(format("Emp_id") + format("Name")+ format("Designation")+ format("Department")+ format("Sales") + "\n" );
        while (dataReader.Read())
        {
            output = output + format(dataReader.GetValue(0).ToString()) + format(dataReader.GetValue(1).ToString()) + format
            (dataReader.GetValue(2).ToString()) + format(dataReader.GetValue(3).ToString()) + format(dataReader.GetValue(4).ToString()
            + "\n";
        }
        Console.WriteLine(output);
        dataReader.Close();
        command.Dispose();
        conn.Close();
    }
    catch (Exception e)
    {
        Console.WriteLine(e);
    }
}
```

```
class Program
{
    0 references
    static void Main(string[] args)
    {
        Database db1 = new Database();
        //Console.WriteLine("Creating a table");
        //db1.create();
        //Console.WriteLine("Inserting into a table");
        //db1.insert();
        Console.WriteLine("Reading a table");
        db1.read();
        //Console.WriteLine("Deleting all entries");
        //db1.delete();
        //Console.WriteLine("Reading a table");
        //db1.read();

        Console.ReadKey();
    }
}
```

Output:

```
Reading a table
Emp_id      Name      Designation  Department  Sales
1           Raj       Manager      Sales       35000
```

Program 1: Write a C# Windows based application to implement a functionality to insert a new record in the table

Code:

```
3 references
public partial class Form1 : Form
{
    1 reference
    public Form1()
    {
        InitializeComponent();
    }
}

1 reference
private void bt1_Click(object sender, EventArgs e)
{
    string conn_str = @"Data Source=(localdb)\ProjectsV13;Initial Catalog=Demodb;Integrated Security=True;Connect
    Timeout=30;Encrypt=False;TrustServerCertificate=False;ApplicationIntent=ReadWrite;MultiSubnetFailover=False"
    ;
    SqlConnection conn = new SqlConnection(conn_str);
    string sql = @"INSERT INTO employee VALUES ( '" + txt2.Text + "', '" + txt3.Text + "', '" + txt4.Text + "', '" +
    txt5.Text + "')";
    SqlCommand cmd = new SqlCommand(sql, conn);
    try
    {
        conn.Open();
        cmd.ExecuteNonQuery();
        conn.Close();
        MessageBox.Show("Record Inserted");
    }
    catch (Exception err)
    {
        MessageBox.Show(err.ToString());
    }
}
```

Output:

Emp_id	5
Name	abc
Designation	xyz
Department	qwerty
Salary	12345

Program 2: Write a C# Windows based application to implement a functionality to display specific record from the table

Code:

```
1 reference
private void btn2_Click(object sender, EventArgs e)
{
    string conn_str = @"Data Source=(localdb)\ProjectsV13;Initial Catalog=Demodb;Integrated Security=True;Connect
        Timeout=30;Encrypt=False;TrustServerCertificate=False;ApplicationIntent=ReadWrite;MultiSubnetFailover=False";
    ;
    SqlConnection conn = new SqlConnection(conn_str);
    string sql = @"SELECT name,designation,department,salary from employee where emp_id=" + txt1.Text+"";
    SqlCommand cmd = new SqlCommand(sql, conn);
    SqlDataReader dr;
    try
    {
        conn.Open();
        dr = cmd.ExecuteReader();
        while (dr.Read())
        {
            txt2.Text = dr.GetValue(0).ToString();
            txt3.Text = dr.GetValue(1).ToString();
            txt4.Text = dr.GetValue(2).ToString();
            txt5.Text = dr["salary"].ToString();
        }
        dr.Close();
        cmd.Dispose();
        conn.Close();
    }
    catch (Exception err)
    {
        MessageBox.Show("" + err);
    }
}
```

Output:

The screenshot displays a Windows application window with a light gray background. It contains five text boxes for displaying employee data, each with a label to its left: 'Emp_id' (value: 1), 'Name' (value: Raj), 'Designation' (value: Manager), 'Department' (value: Sales), and 'Salary' (value: 35000). At the bottom of the window, there are two buttons: 'Add' and 'Read'. The 'Read' button is highlighted with a blue border, indicating it was the last active control.
